Cutting tools – cutting-edge technology for machining processes

No car runs, no plane flies and no artificial joint could be inserted without cutting tools.

In recent years, the world of tool manufacturers has changed fundamentally. Ever more customers no longer purchase bare tools but demand the best possible solution for a specific production task. Thus, the tool manufacturer's influence on the configuration of the customer's production process is constantly increasing. Today, highly innovative production solutions, tailored for the specific tasks of the individual customer, dominate the market.

After all, the precision tools manufacturer's production know-how is the decisive factor for the success of manufacturers worldwide.

Cutting tools

Clamping technology – crucial link in the production process

Innovative clamping technology ensures process stability, consistently high machining quality and competitive set-up costs.

To meet today's requirements concerning workpieces and machining, manufacturers of clamping technology provide their customers with a variety of innovative solutions which, in combination with machine and tool, result in maximum accuracy. The range includes mechanically, pneumatically, hydraulically or electrically driven rotary and stationary work holders, tool holders, clamping devices for press tools, ... and countless clamping components and systems.

Die and Mould Making for your competitive advantage!

The companies in the Die and Mould industry manufacture individual means for the production of manufacturing companies. Often a single tool or mould gives shape to thousands of products. Only up to five percent of the production costs can be attributed to the tools – but in return, they are responsible for the speed and stability of the production process as well as for product quality.

This industry segment comprises of stamping dies, cutting- and forming tools, injection moulds, die casting moulds, jigs and standard parts.

Other precision tools and supporting technologies

Forming processes such as thread rolling, knurling or diamond burnishing are as well represented here as surface coatings, special alloys, sensors and lubricants. The latter enable a more efficient machining. Special coatings protect tools, against abrasive wear and tear, prevent the adhesion of worn material or provide maximum smoothness for cooler machining. Today, many high-performance applications are only achievable with an individual technology mix of tools, coating and lubrication – our members will be happy to provide you with support.
